AtliQ Grands: what 134,573 bookings reveal

Revenue and occupancy analysis · 25 hotels · 4 cities · May–July 2022

Saurabh S · October 2026
Based on the AtliQ Hotels project from the CodeBasics Python course (fictional data)

The data and how I approached it

25
properties

4
cities

92
days

134,573
bookings

1. Review
Profile every table and list the data issues

2. Clean
Remove impossible rows and fix date formats

3. Measure
Weighted occupancy, RevPAR, realisation, channel mix

4. Recommend
Size the opportunities and suggest next steps

Tables: bookings, daily aggregated bookings, hotels, rooms, dates, plus one week of August data appended

Three months at a glance

₹170.9 Cr
revenue realized

57.9%
occupancy (rooms booked ÷ available)

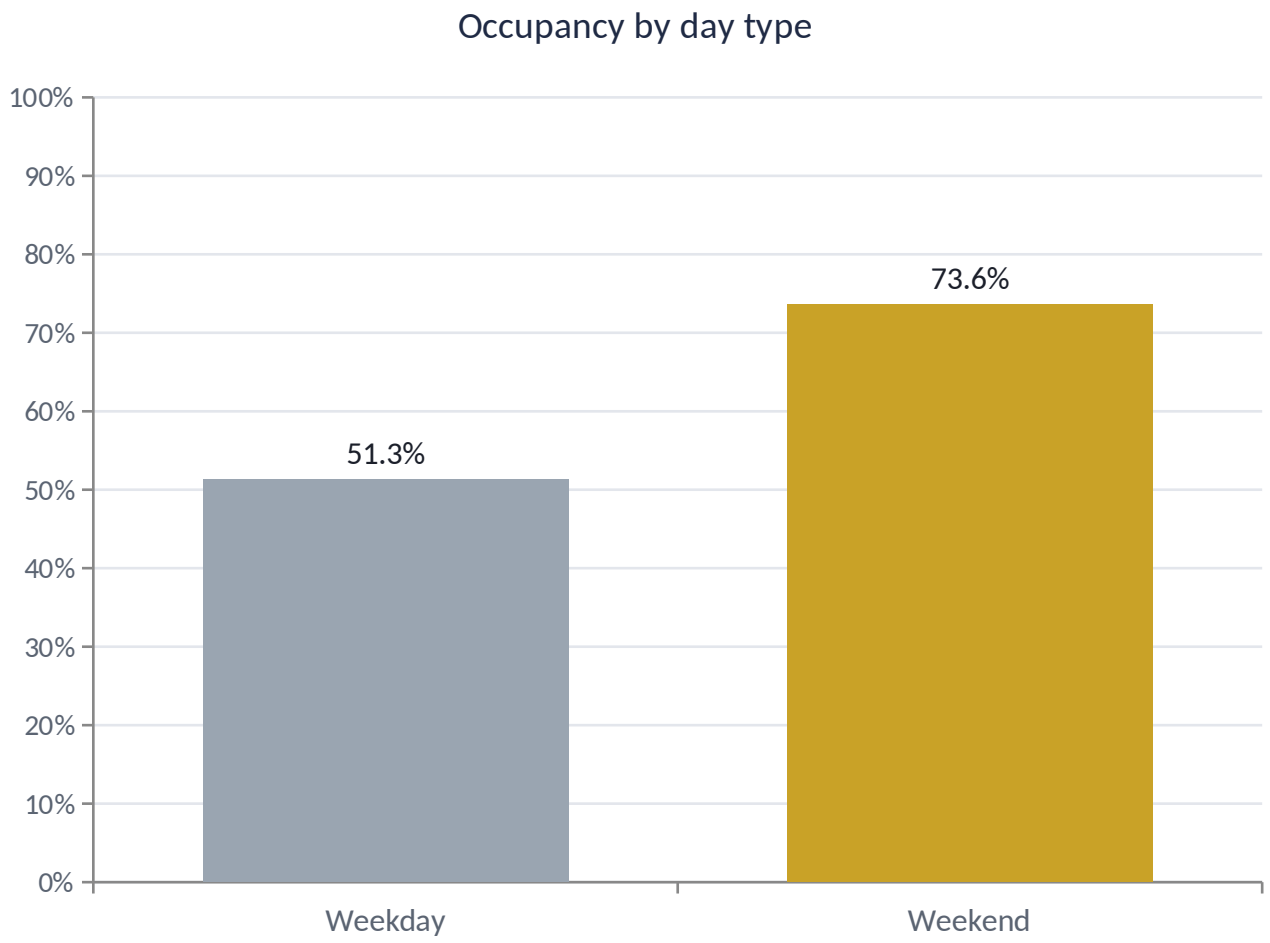

₹7,351
RevPAR (revenue per available room)

85.1%
of booked value actually realized

24.8%
of bookings cancelled

3.62 / 5
average rating (only 42% of guests rate)

Weekends are full; weekdays are half empty

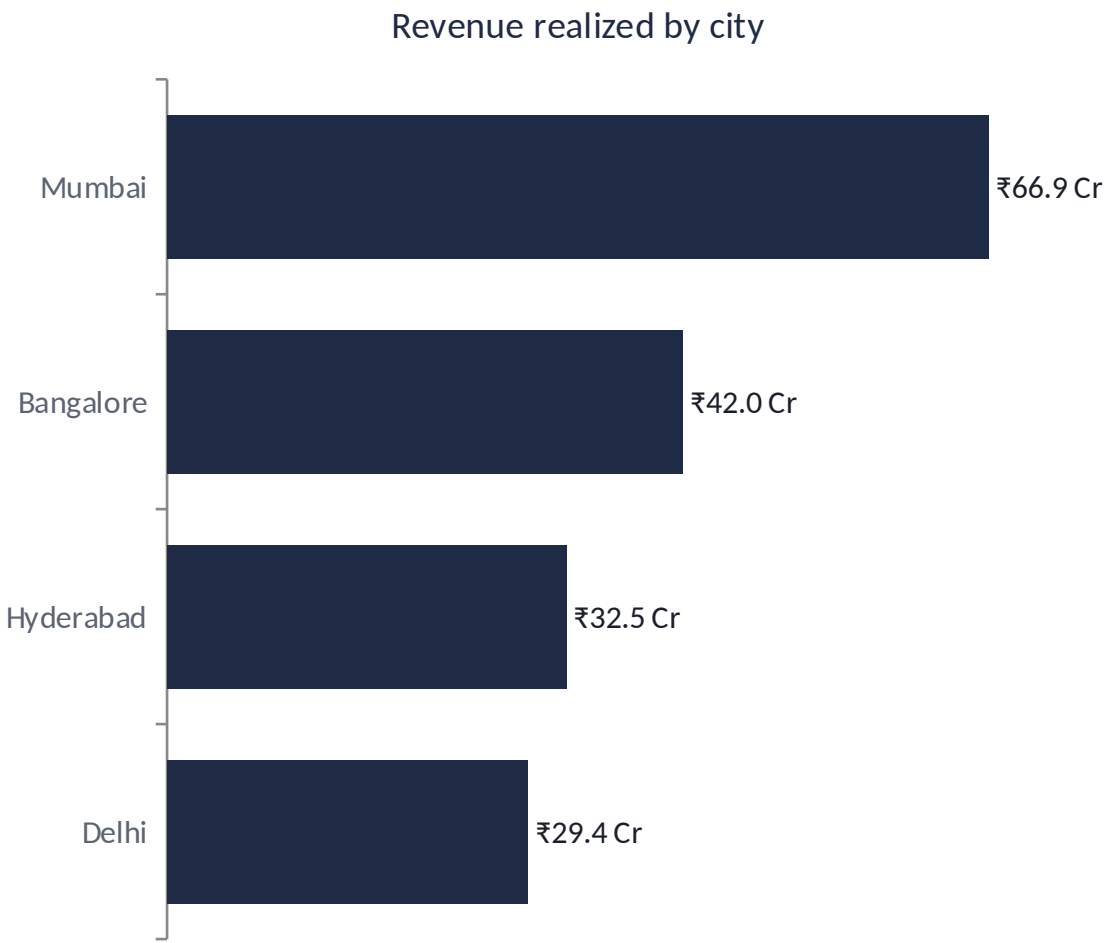

22 pts
gap between weekend and weekday occupancy

71%
of all available room-nights fall on weekdays

Every 5-point lift in weekday occupancy ≈ 8,200 more bookings, about ₹10 Cr a quarter

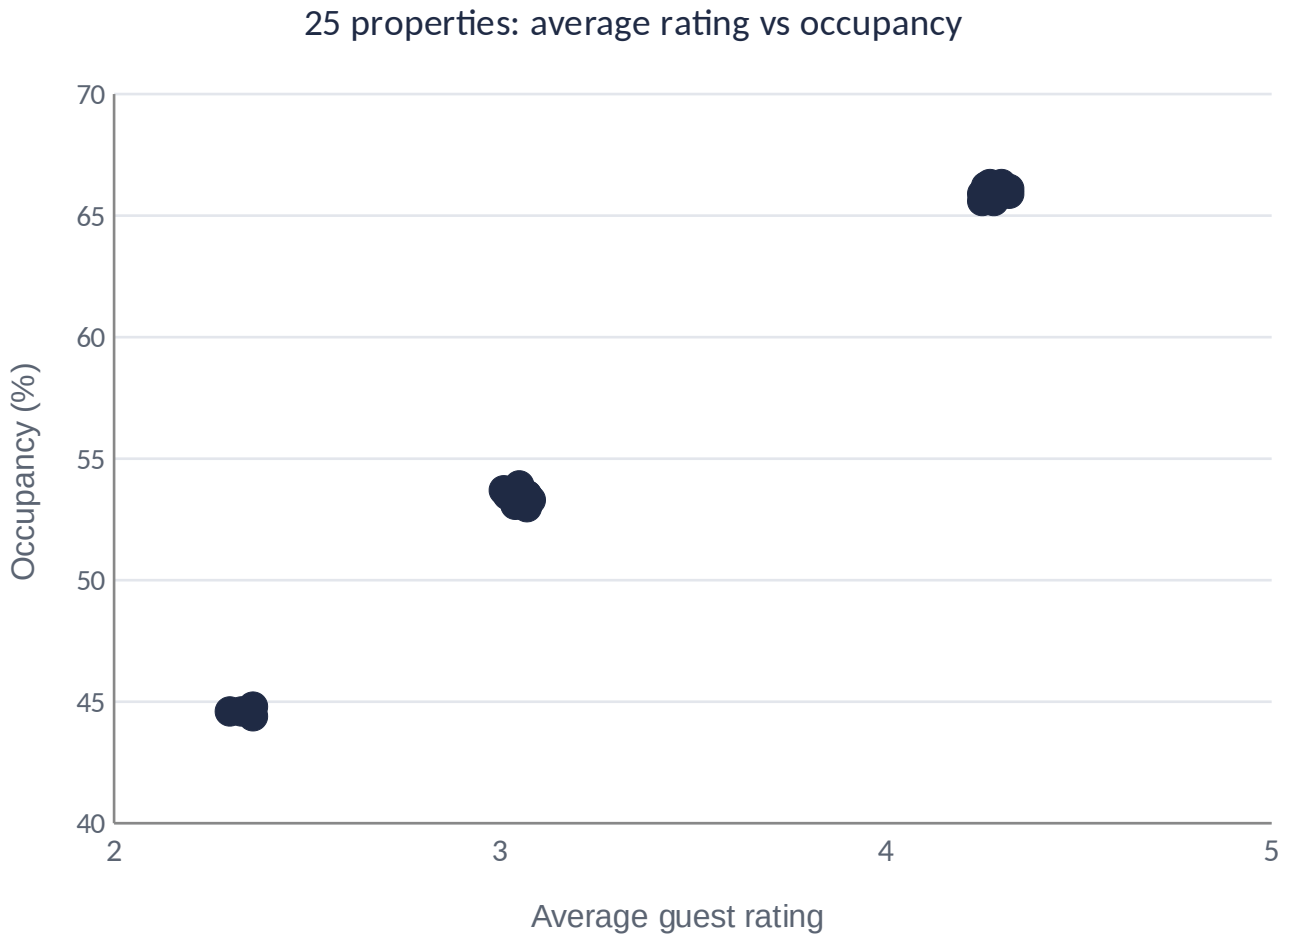

Mumbai earns the most; Delhi fills the best

City	Hotels	Occupancy	RevPAR	Rating
Mumbai	8	57.9%	₹8,908	3.65
Bangalore	6	55.8%	₹7,334	3.41
Hyderabad	6	58.1%	₹5,414	3.66
Delhi	5	**60.5%**	₹7,364	**3.78**

Delhi has the fewest hotels but the highest occupancy and ratings: a case for adding capacity there. Mumbai's RevPAR leads; Hyderabad's lags.

Guest ratings move almost perfectly with occupancy

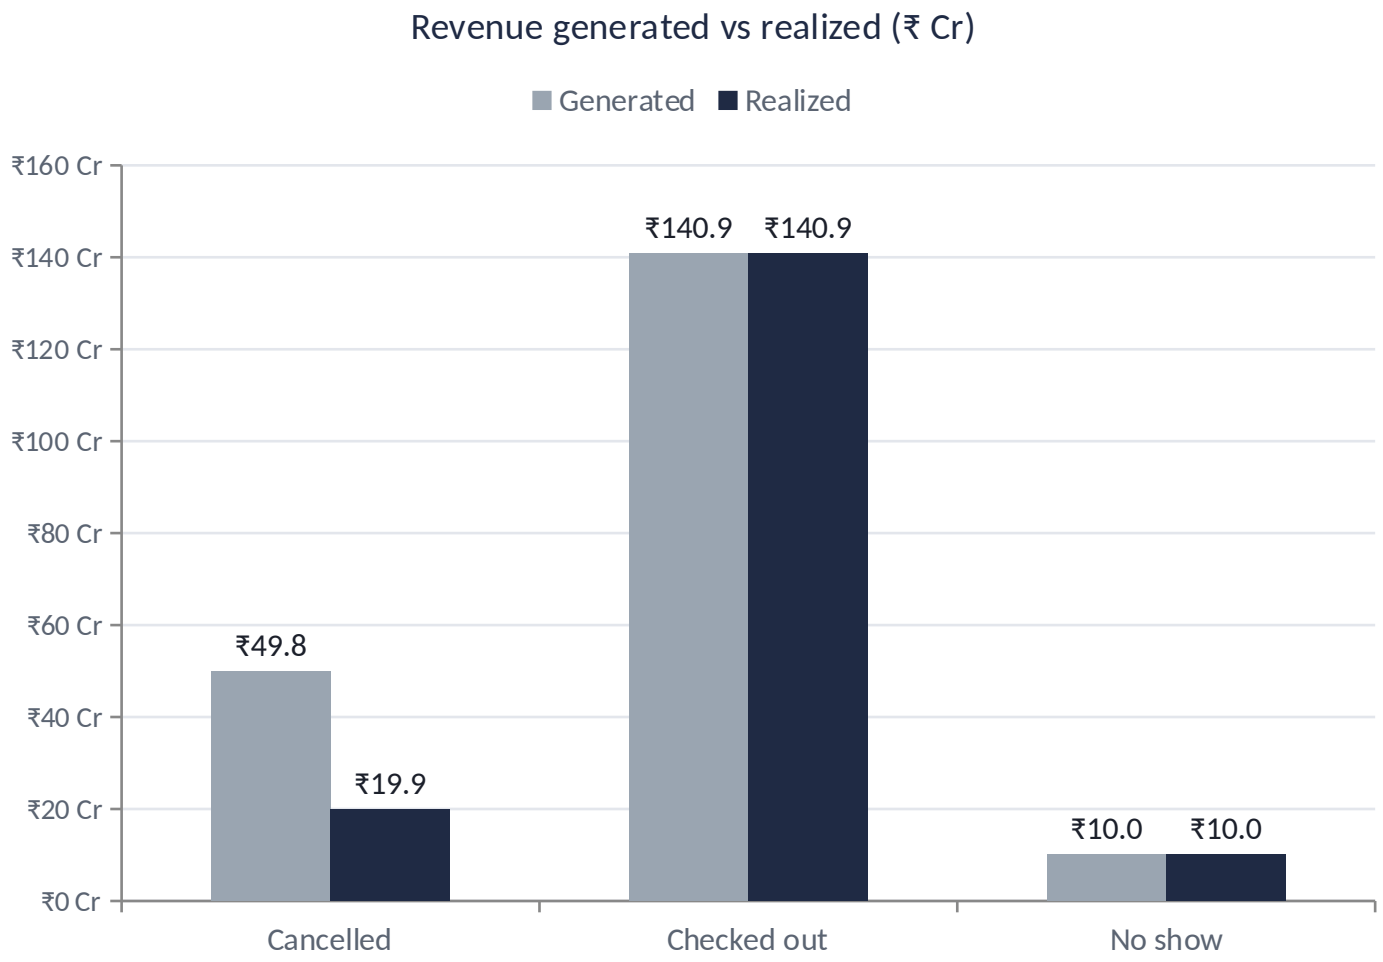

★ 4.28 → 66%
12 high-rated hotels: average rating → occupancy

★ 3.05 → 53%
9 mid-rated hotels: average rating → occupancy

★ 2.34 → 45%
4 low-rated hotels: average rating → occupancy

r = 0.998 · Low tier: Atliq Seasons & Atliq Bay (Mumbai), Atliq Exotica (Hyderabad), Atliq Grands (Bangalore)

Cancellations are the biggest revenue leak

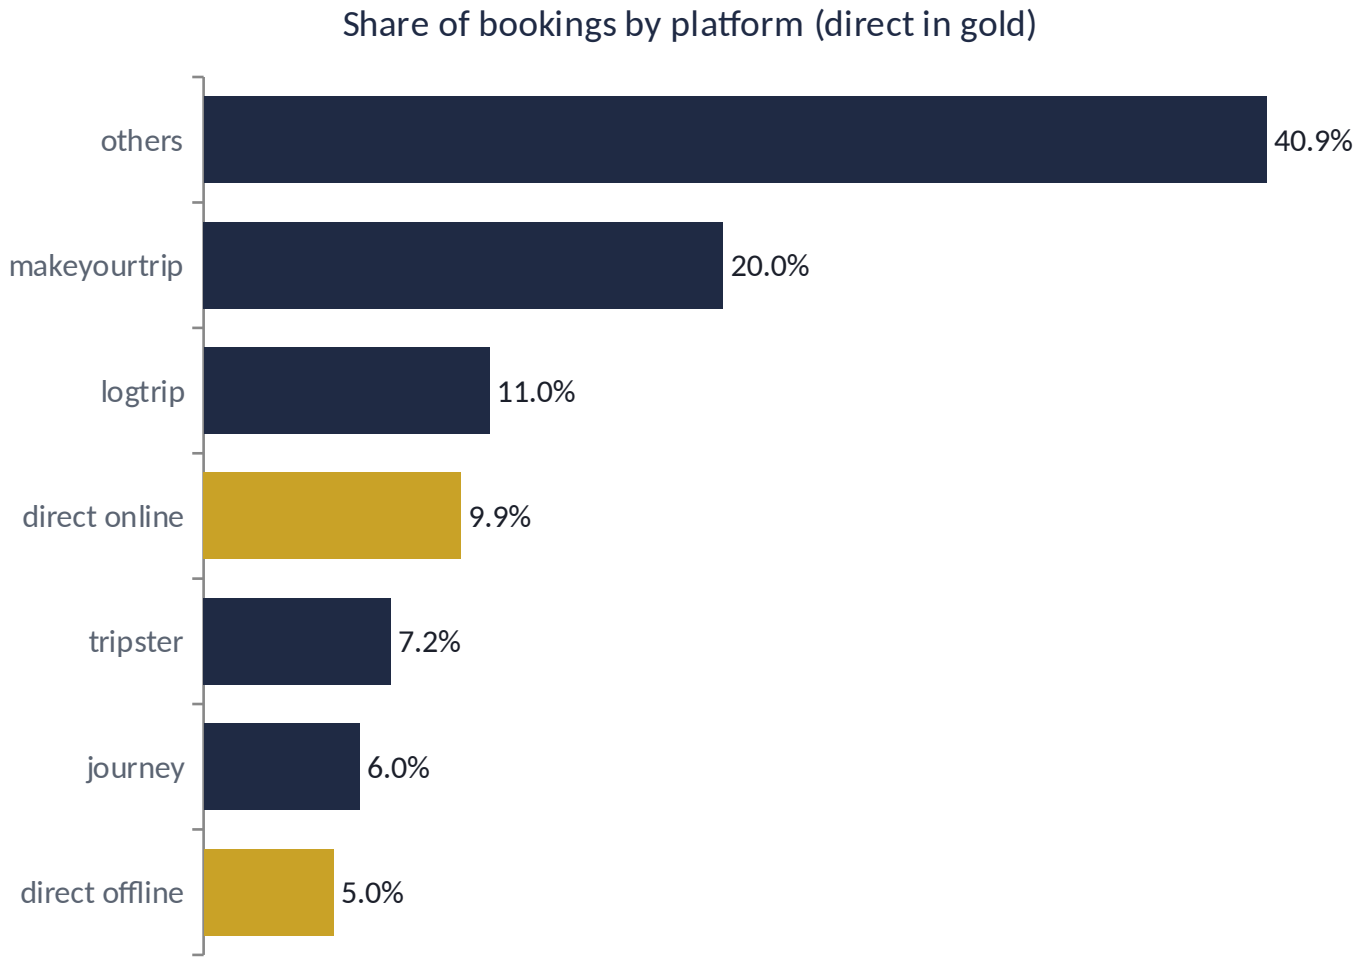

₹29.9 Cr
booked but never realized

40%
of a cancelled booking's value is kept

≈25%
cancellation rate on every platform

Only 15% of bookings come direct

85% via third parties
"Others" alone brings 41% of bookings, so it's worth breaking down further

Same guests, same behaviour
Cancellation (~25%) and ratings (3.62) are identical across platforms

Room to save on commission
Each booking moved direct avoids an agency fee

What the course notebook missed, and why it matters

Check	Course notebook	Corrected
Revenue in the monthly view	**₹117.6 Cr (31% missing)**	₹170.9 Cr
Days used for occupancy	**10th–31st only (29% of rows dropped)**	All 92 days
Weekday / weekend occupancy	50.9% / 72.3%	51.3% / 73.6%
Missing capacity filled with	Overall median: 25	Property's own: 26 and 20
Occupancy method	Average of daily % (58.3%)	Rooms booked ÷ available (57.9%)
August data appended	15 columns, % column unmatched	13 aligned columns

Root cause: dates stored as text in different formats
'1-May-22' never matched '01-May-22', and '1/5/2022' (1 May) was read as 5 January. No error appeared either time.

Where I'd focus next

Fill weekdays
Corporate rates, weekday packages and events. +5 pts ≈ ₹10 Cr a quarter

Fix the four low-rated hotels
Review guest feedback and service. Mid-tier occupancy ≈ ₹4.3 Cr a quarter

Reduce cancellations
Prepaid non-refundable rates, reminders before arrival, and smarter overbooking

Grow direct bookings
Loyalty perks and best-rate guarantees, starting with the 41% booked via "others"

Invest where demand is proven
Delhi: highest occupancy and ratings, with the fewest hotels

Ask more guests to rate
Only 42% leave a rating, yet ratings track occupancy closely

Opportunity sizes are rough estimates: extra bookings × average realized revenue per booking (₹12,696).

What this project taught me

Reconcile before you report
A clean-looking chart hid 31% of revenue. Totals that tie out are the first test.

Dates are data traps
Two formats and one month-first guess dropped thousands of rows without any warning.

Audit habits transfer
Profiling, completeness checks and documented judgments work as well on hotels as on ledgers.
